**RE: LMC MANTECA
DETENTION BASIN CAPACITY REVIEW**

Dear Tyler,

The purpose of this letter is to document the review of the existing detention basin located south of E Atherton Drive and to determine if it has sufficient capacity to accommodate the proposed Emblem development.

Study Area

The study area covers approximately 97 acres located in the southern portion of Manteca along Highway 120. Within this area approximately 61 acres will be developed as the LMC Manteca project including single family and multifamily housing. The remaining study area includes existing roadways, existing detention basin, and existing parcels not part of the development but tributary to the existing detention basin.

Detention Basin Size Review

The study area is planned to ultimately drain to the existing detention basin built to the south of E. Atherton Drive. This was determined in 2011 at the time the extension of E. Atherton Drive was designed and the associated city storm drainage infrastructure (see attached Exhibit A). Based on the calculations prepared in 2011 the basin was sized per the following criteria:

- Detain the full volume of the 10-year, 24-hr design storm
- Discharge the volume over a 96-hr period

These criteria are consistent with the 2006 “SSJID City of Manteca Storm Drainage Agreement” and further defined in the “City of Manteca Storm Drain Master Plan”, dated 2013. Specifically

See Exhibit B for a copy of the original calculations prepared by MCR Engineering which note a total storage volume of 20.81 ac-ft as required based on a mixture of Commercial and Medium Density Residential land uses.

The proposed development includes less intensive land uses, such as low density residential, and results in a slightly lower total volume of 17.60 ac-ft requirement. This includes the assumption that any remaining undeveloped land within the watershed could be commercial, resulting in the highest amount of run off. See Exhibit C for a summary of the proposed land uses and Exhibit D for the required volume calculations.

Per the Atherton Gap Record documents dated May 29, 2014 the detention basin was constructed with a total storage volume of approximately 20.16 ac-ft, which is larger than the 17.60 ac-ft required. This is based on a high-water level of 33.34 ft, a toe of bank elevation of 24.2 ft, 3:1 side slopes, and a base area of roughly 80,478 sqft. See Exhibit E for an excerpt of the record documents and Exhibit F for a calculation of the volume.

To confirm that the volume is available a topographic survey of the basin was prepared. The results of this survey show that the toe of slope varies from 24.3 to 24.9 feet however the overall basin dimensions and top of bank are essentially the same as the record documents. Some parts of the basin perimeter do not reach the design elevation of 34.34 with the lowest point being 34.05. Assuming the 1-foot freeboard must be maintained the high-water elevation becomes 33.34 and coupled with the higher toe of slope elevation this results in a smaller storage volume, 18.06 ac-ft vs 20.16 ac-ft, however it is still greater than the required volume of 17.60 ac-ft. The topographic survey is attached as Exhibit G and the associated volume calculations as Exhibit H.

Conclusion

The proposed LMC Manteca development is consistent with the design assumptions used to develop the detention basin. Per the calculations and topographic survey the existing detention basin has sufficient capacity to accommodate the proposed LMC Manteca development.

Please feel free to contact us with any questions.

Regards,

SANDIS

Michael Kuykendall, PE

EXHIBIT C PROPOSED LAND USE

SHEET

Volume Requirements, per section 3.7.3 of 2013 SDMP:

Design Frequency = 10 year
 Rainfall Depth, R = 3.56 inches 0.30 ft

2011 Calculations

From Atherton Gap Closure project

	C	I (ft)	A (ac)	V (ac-ft)
Commercial	0.75	0.30	82.23	18.30
Medium Density Res	0.45	0.30	12.26	1.64
Basin	1.00	0.30	2.86	0.85
Total			97.35	20.78

Required Volume of Storage (100%)= 20.78 ac-ft 905,236 cf

Note: The 2011 calculations appear to have a rounding error and state the required volume as 20.81 ac-ft. This difference is nominal and not considered significant

2022 Calculations

	C	I (ft)	A (ac)	V (ac-ft)
Commercial	0.75	0.30	26.26	5.84
High Density Res	0.65	0.30	32.04	6.18
Medium Density Res	0.50	0.30	0	0.00
Low Density Res	0.30	0.30	29.18	2.60
Right of Way	1.00	0.30	7.2	2.14
Basin	1.00	0.30	2.86	0.85
Total			97.54	17.60

Required Volume of Storage (100%)= 17.60 ac-ft 766,774 cf

Notes: The runoff coefficients for the 2022 calculations are based on the Storm Drain Master Plan and zoning regulations (see correlation table below).

Correlation of Runoff Coefficients

Per Table 3-3 of SDMP		Per Tables 17.20.020-1 and 17.26.020-1		
Land Use	Runoff Coefficient (C)	Equivalent Zoning	Min Density (du/ac)	Max Density (du/ac)
Very Low Density Residential (VLDR)	0.30	R-E	0.5	2
Low Density Residential (LDR)	0.30	R-1	2.1	8
Medium Density Residential (MDR)	0.50	R-2	8.1	15
High Density Residential	0.65	R-3	15.1	25
